

inner surface of said covering element and adapted to be engaged in said top mouth to tightly closed said top mouth, wherein said annular gasket is also an integral part of said covering element and is made of a second material different from said first material, thereby said container body, said covering element, said strip hinge and said gasket provide a single piece container body, covering element, said strip hinge and sealing gasket container assembly which can be opened and tightly closed by causing said covering element to pivot about said strip hinge.

17. (new) A method for making a cosmetic product container, according to Claim 16, comprising a step of injecting a first material and a second material for making an integral assembly constituted by a container body, having a top open mouth, a covering element therefore and a strip hinge integrally coupling said container body and covering element, said second material being different from said first material in order to form an annular gasket integral with an inner surface of said covering element for tightly closing top open mouth of said container body by causing said covering element to pivotably swing about said strip hinge.

18. (new) A method according to Claim 17, comprising the further steps of forming, by blow molding through said top open mouth of said container body a cosmetic product vial or tube.
